AJCC Version 9 Staging

Updates

This release contains updated **TNM values**, **Staging Groups**, and **Template functionality** to align with **AJCC version 9** conditions for:

- Lung cancer, Non Small cell (NSCLC)
- Lung cancer, Small cell (SCLC)

Users will see updated values and descriptions for **Primary Tumor Type (T)**, **Regional Lymph Nodes (N)**, and **Distance Metastasis (M)**, documentation points:

- The following **Distance Metastasis (M)** value is **no longer** available:
 - **MX**
- The following **Distance Metastasis (M)** values **are now** available:
 - **M1c1**
 - **M1c2**

The following **Primary Tumor Type (T)** documentation points updated descriptions:

T Value	Description
T1a	Tumor ≤ 1 cm in greatest dimension or Tumor of any size whose invasive component is limited to the bronchial wall and may extend proximal to the main bronchus, this is an uncommon superficial, spreading tumor

T Value	Description
T2a	Tumor > 3 cm but ≤ 4 cm in greatest dimension OR Tumor ≤ 4 cm in greatest dimension with one or more of the following features: (Invades visceral pleura, Invades an adjacent lobe, Involves main bronchus (up to but not including the carina) or associated with atelectasis or obstructive pneumonitis, extending to the hilar regions, involving either part of or the entire lung)
T2b	Tumor > 4 cm but ≤ 5 cm in greatest dimension with or without any of the following features: (Invades visceral pleura, Invades an adjacent lobe, Involves main bronchus (up to but not including the carina) or associated with atelectasis or obstructive pneumonitis, extending to the hilar regions, involving either part of or the entire lung)
T3	Tumor > 5 cm but ≤ 7 cm in greatest dimension OR Tumor ≤ 7 cm with one or more of the following features: (Invades parietal pleura or chest wall, invades pericardium, phrenic nerve or azygos vein - although these structures lie within the mediastinum, the degree of mediastinal penetration by the tumor needed to invade these structures is not counted as T4, Invades thoracic nerve roots (i.e., T1, T2) or stellate ganglion, Separate tumor nodule(s) in the same lobe as the primary)
T4	Tumor > 7 cm in greatest dimension OR Tumor of any size with one or more of the following features (Invades mediastinum (except structures listed in T3), thymus, trachea, carina, recurrent laryngeal nerve, vagus nerve, esophagus or diaphragm intrapericardial pulmonary arteries/veins), supra-aortic arteries or brachiocephalic veins, Invades subclavian vessels, vertebral body, lamina, spinal canal, cervical nerve roots or brachial plexus (i.e., trunks, divisions, cords, or terminal nerves), Separate tumor nodule(s) in a different ipsilateral lobe than that of the primary)

The following **Regional Lymph Nodes (N)** documentation points have updated descriptions:

N Value	Description
N0	No tumor involvement of regional lymph node(s)
N1	Tumor involvement of ipsilateral peribronchial and/or ipsilateral hilar and/or ipsilateral intrapulmonary lymph node station(s), including involvement by direct extension

N Value	Description
N2a	Tumor involvement of a single ipsilateral mediastinal nodal station or of the subcarinal lymph node station
N2b	Tumor involvement of multiple ipsilateral mediastinal nodal stations with or without involvement of the subcarinal lymph node station
N3	Tumor involvement of contralateral mediastina, contralateral hilar, ipsilateral/contralateral scalene, or ipsilateral/contralateral supraclavicular lymph node station(s)

The following **Distance Metastasis (M)** documentation points have updated descriptions:

M Value	Description
M1a	Metastasis in pleural or pericardial nodules, and/or malignant pleural or pericardial effusions, and/or separate tumor nodule(s) in a contralateral lobe Note: Most pleural (pericardial) effusions with lung cancer are a result of the tumor. In a few patients, however, multiple microscopic examinations of pleural (pericardial) fluid are negative for tumor, and the fluid is non-bloody and not an exudate. If these elements and clinical judgment dictate that the effusion is not related to the tumor, the effusion should be excluded as a staging descriptor.
M1b	Single extrathoracic metastasis in a single organ system (including involvement of a single non-regional node)
M1c1	Multiple extrathoracic metastases in a single organ system. For example, the skeleton is considered one organ. Several metastases in a single bone or several metastases in several bones are classified as M1c1
M1c2	Multiple extrathoracic metastases in multiple organ systems
